Psychotropic Drugs

H. M. van Praag
In the past 25 years there has been a revolution in mental health care. This has
been largely related to the introduction of psychotropic drugs and the new era of
psychopharmacology.

Now in this volume, an internationally recognised leader in this field presents a
comprehensive survey of the entire range of psychotropic drugs, including the
pharmacotherapy of psychoses, of disturbances in mood regulation and of
disturbances in personality organisation.

Above all this is a highly practical volume oriented to the needs of those specialists
and general practitioners who prescribe psychotropic drugs, as well as all those
concerned with therapy who must be familiar with the areas of application of
these drugs and their effects on patients.

£12.00; 492pp; 0 333 24643 8
