SPECIES IDENTIFICATION IN 18 HOURS with API 20E STANDARDIZED WORLD-WIDE

API 20E Profile, derived from a pre-set battery of 21 biochemical tests—greatly facilitates the fast and accurate identification of Enterobacteriaceae biotypes, including rare and other gram-negative organisms. Allows users of the system on every continent to share in the discovery of newly-identified API Profiles.

Through computerization, all 21 biochemical tests are interpreted simultaneously to permit standardized interpretation of biochemical results based on over 35,000 organisms. Because of its large battery of biochemical tests, the API 20E Profile virtually eliminates the possibility of mis-identification due to incomplete testing. The API 20E not only species identifies all Enterobacteriaceae in 18 hours, but also recognizes the less commonly seen biotypes such as H₂S—, CIT—, Salmonella, Ind—, E. coli, TDA—, P. morganii in one day, economically, without second day testing.

See how your collection of difficult-to-identify organisms look on API 20E in your laboratory. For a no-obligation demonstration call (516) 433-0620, or write:

The Inolex Enteric Concept employs a miniaturized card approach coupled with numerical taxonomy for the identification of enteric bacteria.

It is a versatile system combining the features of speed, accuracy, convenience, design and economy into one complete and superior product.

In addition, the system offers the choice of three time modes, giving it the flexibility to adapt to individual laboratory requirements—a feature available only with the Inolex Enteric Concept.

OPPORTUNISTIC Fungal Infections: Proceedings of the Second International Conference edited by Ernest W. Chick, Univ. of Kentucky Medical School, Lexington; Albert Balows, Center for Disease Control, Atlanta, Georgia; and Michael L. Furcolow, Univ. of Kentucky Medical School, Lexington. (34 Contributors) This text relates the clinical, immunological and cultural observations of a group of international authorities in this area. Specific facets of fungal infections discussed include the general scope of opportunistic fungal infections, serological and immunological aspects, clinical aspects, specific diseases, and veterinary and therapeutic aspects. '75, 376 pp., 55 il., 34 tables, $22.50

AMEBIASIS IN MAN compiled and edited by Carlos A. Padilla y Padilla, Hospital General San Juan de Dios, Guatemala City, Guatemala, and George M. Padilla, Duke Univ. Medical Center, Durham, North Carolina. (8 Contributors) The expertise and collective knowledge of biologists, pathologists, clinicians and laboratory investigators with experience with this disease are presented in this book. The chapters cover epidemiology, pathology, diagnosis, symptomatology, therapeutics and public health aspects of the disease. Technical procedures as well as theoretical aspects relevant to the treatment of the disease are included. '74, 198 pp. (7 x 10), 101 il., 5 tables, $13.95

AN ELECTRON MICROGRAPHIC ATLAS OF VIRUSES by Robley C. Williams, Univ. of California, Berkeley, and Harold W. Fisher, Univ. of Rhode Island, Kingston. Primarily intended to be a visual compendium of the structure of some of the better known viruses, this book was written for the sake of those readers or viewers who are not experts in virology. It contains a short essay with a reading list on the salient features of each virus illustrated. In addition an extensive Introduction discusses some of the most recent techniques of the electron microscope and the architectural principles of virus construction. '74, 152 pp. (8 1/2 x 11), 56 il., 1 table, $17.50

THE COLOR ATLAS OF INTESTINAL PARASITES (Rev. 6th Ptg.) by Francis M. Spencer, San Angelo Medical and Surgical Clinic, San Angelo, Texas, and Lee S. Monroe, Scripps Clinic and Research Foundation, La Jolla, California. Foreword by Ernest Carroll Faust. The 234 original color photomicrographs reproduced in this book demonstrate the characteristic morphology and diagnostic forms of most of the important intestinal parasites of man as they actually appear when viewed through the ordinary laboratory microscope. This atlas will serve as a practical aid in training laboratory technicians, medical students and physicians in the recognition and accurate identification of intestinal parasites. '75, 176 pp., 282 il. (248 in full color), 1 table, $14.75

CLINICAL MICROBIOLOGY: How To Start and When To Stop edited by Albert Balows, Center for Disease Control, Atlanta, Georgia. (6 Contributors) The purpose of this book is to provide generally useful guidance for the processing of specimens. Authoritatively written chapters provide guidance on what is considered minimally acceptable in culturing blood, urine, feces, sputum and wound specimens in a small clinical laboratory. It will be particularly useful in the small to medium sized laboratory that does not have the services of a well trained microbiologist. '75, 104 pp., 5 il., 29 tables, $10.50

DIAGNOSTIC PROCEDURES IN VETERINARY MICROBIOLOGY (2nd Ed., 2nd Ptg.) by G. R. Carter, Michigan State Univ., East Lansing. Introductory chapters discuss selection and submission of clinical specimens, cultural procedures for various specimens, and isolation and identification of bacteria. Descriptions of the important bacteria, fungi, mycoplasmas, rickettsiae and chlamydiae are provided along with notes on pathogenicity and details of appropriate diagnostic procedures. Chapters are provided which deal specifically with the important problem of infectious mastitis and abortion. '75, 370 pp. (6 3/4 x 9 3/4), 76 il. (5 in full color), 59 tables, $16.95, paper

The Cottonseed Protein Nutrients with Worldwide Acceptance

Advantages

- Low cost — (prices on request)
- Uniformity — resulting from rigid quality controls
- Increased Yields — through protein quality
- Availability — readily available all year
- World Wide Acceptance — in industrial fermentations
- Multiple Plant Production — To insure year round availability

Uses:

- Production Fermentors — as a total Nitrogen source
- Production Fermentors — as a partial source of Nitrogen
- Seed Tanks — to promote rapid and abundant growth
- Mutational Development — media reformulations of existing fermentations
- Screening — for isolation of cultures

**Infectious Multiple Drug Resistance**

by S. FALKOW

This book is a documented guide to the study of infectious multiple-drug resistance (R) factors and other bacterial plasmids. The first three chapters review the properties of the classical F-factor and the bacteriophage. Then follows an analysis in depth of the genetics, molecular nature, and replication of R-factors and other plasmids. The ecology of R-factors and their implication for human and veterinary medicine is covered in considerable detail. 1975. 300 pp., 11 plates. $19.95/£7.70

Published by Pion Limited. Distributed by Academic Press.

**The Mitochondria of Microorganisms**

by DAVID LLOYD

This is the first book to embrace the whole field of microbial mitochondria in a single volume. The following topics are dealt with: ultrastructure; isolation; respiration and the respiratory components; environmental modification; mitochondrial DNA; chromosomal and extrachromosomal mutations affecting mitochondrial functions, mitochondrial ribosomes and RNAs; mitochondrial protein synthesis; cooperative synthesis of mitochondrial components, assembly growth and division; evolution. 1974. 568 pp., $36.00/£13.60

**IMPORTANT DISCUSSIONS ABOUT A Viable Alternative—**

**BACULOVIRUSES FOR INSECT PEST CONTROL:** Safety Considerations

**EDITORS: RETO ENGLER, LOUIS A. FALCON, MAX D. SUMMERS**

This important new book comprises the proceedings of a symposium sponsored by the Environmental Protection Agency and the United States Department of Agriculture.

The discussions which are published here centered on the prospect of registering pest management techniques and compounds that are more selective, less persistent, and more environmentally acceptable than broad-spectrum toxicants. The dangers, or potential long-term dangers, of pest control with viruses were examined, as were the positive aspects of such programs.

Updated to the state of knowledge of May 1975, this book will be of value to all scientists interested in virology, ecological microbiology, agricultural science, pesticides, and entomology.

**December 1975, 186 pages. $9.00**

(Available to members of ASM at $5.00. Please enclose remittance with order.)

BACT-CHEK" adds...

TWO QUALITY CONTROL EXTRAS
AT NO EXTRA COST

• Klebsiella pneumoniae
• Shigella sonnei

New Expanded BACT-CHEK

Now, two new organisms have been added to BACT-CHEK to further expand its area of quality control in the bacteriological laboratory. A clinical study evaluating the eight-organism kit found it a valuable system for establishing a quality control program for 90% of the media and reagents used for non-mycobacterial, aerobic bacteria. The new 10-organism BACT-CHEK kit not only continues to provide convenience and reliability but also increases its range of usefulness.

This expanded system offers organisms for control testing of biochemical test media, chemical reagents, and antibiotic sensitivity discs and growth media. And, BACT-CHEK provides an economical quality control program for only pennies a day. This economy factor also includes economy of time and storage space since BACT-CHEK eliminates the need to maintain stock cultures, thereby avoiding the risk of possible contamination and mutation.

Consistent Disc Viability and New, Easy-open Package

BACT-CHEK has a consistent viable count of 105 to 106 organisms assuring the availability of a sufficient quantity for all routine testing procedures. BACT-CHEK discs are also standardized to ensure bacterial uniformity each and every time. These exclusive features provide reliability, flexibility and economy in maintaining routine laboratory quality control. And, BACT-CHEK now comes in a new, easy-to-open pull-top can.

10 Organisms Basic to Quality Control

Enterobacter cloacae
Escherichia coli
("Seattle" Strain)
Klebsiella pneumoniae
Proteus vulgaris
Pseudomonas aeruginosa
Salmonella typhimurium
Shigella sonnei
Staphylococcus aureus
("Seattle" Strain)
Staphylococcus epidermidis
Streptococcus pyogenes

Available in a kit containing 10 vials of 30 discs per vial (1 vial of each organism). Item No. 43076 and Seattle Strains of E. coli and Staph. aureus as single vials of 30 discs per vial. Item No. 43077

NEW BACT-CHEK®
the flexible program of quality control

The BACT-CHEK Program of Quality Control includes a valuable and exclusive no-cost extra.

The BACT-CHEK Manual is a complete guide to the establishment of mini- or maxi-programs of microbiological quality control. It includes information on what should be tested, how often, which BACT-CHEK organisms to use and how to use them and, finally, provides a supply of log sheets for all areas to be checked. This manual may be obtained free-of-charge from your Roche representative.

For media that measures up to the exacting demands of your work, consider Inolex Biomedical next time you need dehydrated culture media, ingredients or peptones. We believe that careful raw material selection and technical expertise can make a big difference in quality. As a result, Inolex supplies the finest microbiological products available today.

You can count on consistent results time after time. We guarantee the highest quality media, manufactured from the finest raw materials, under a quality control system so rigid you'll find little difference between the media you use today, tomorrow, next month or next year. All batches are tested against standard specifications, challenged in growth tests and examined to confirm stability.

 Totally committed to microbiology, Inolex Biomedical can satisfy needs in pharmaceutical, cosmetic, food, public health or clinical laboratory... including special formulations and USP sterility testing media. And we'll serve you with no interruptions or backorders.

Just write or call and we'll send full product information. Or better yet, give us a chance to demonstrate our quality and service. Order a trial supply of dehydrated culture media, ingredients or peptones and use it in your laboratory. If it does not give you satisfying, consistent results, just let us know. We'll refund your full purchase price.

MEDIA THAT MEASURES UP
who is number 1 in Membrane Filters (MF)?

WHO IS FIRST IN QUALITY? . . . . . . This is a difficult choice, often depending on applications and personal preferences. Sometimes it is a tossup. For specific types of membranes, differences are evident. Try Gelman, and let your own needs decide.

"Tests of two leading brands of membrane filters used for enumerating fecal coliform bacteria showed that Gelman GN-6 filters recovered statistically more colonies of bacteria than did Millipore HA8G 04750 filters from pure cultures incubated at either 35 C (the optimal growth temperature) or 44.5 C (the standard temperature for the fecal coliform test). Standard membrane filter procedures with M-FC broth base were used to enumerate the organisms. Densities of colonies incubated on Gelman filters at 44.5 C averaged 2.3 times greater than those on Millipore filters."

WHO IS FIRST IN VARIETY? . . . . . . Recognizing the need for broad versatility, Gelman has developed not only standard membranes comparable with the competition, but also many with special characteristics.

WHO IS FIRST IN SERVICE? . . . . . . Consider Gelman’s more than 60 dealer branches throughout the U.S., Canada, and Europe. Consider Gelman Distributor Representatives, probably visiting you every week. Consider the technical support and backup from Gelman Technical Representatives. Consider the Consultation Service provided by Gelman’s scientists and applications engineers from our home plant in Ann Arbor.

WHO IS FIRST IN COST? . . . . . . No question when you compare costs. Can you ever take advantage of obvious savings if you always buy from a single source? Try Gelman’s quality and better prices.

WHO IS FIRST IN SALES? . . . . . . Gelman is not number one in sales, but if you’ve read this far, chances are we’re closer. USE THE COUPON FOR ALL THE FACTS ON GELMAN’S "NEW DIMENSIONS" BULLETIN ON MEMBRANES AND MEMBRANE FILTRATION. Then you can decide which filters you want in your laboratory.

There is more than one answer to blood culturing

We don’t claim all the answers. Just more than anyone else

Consider

- Widest Choice of Media for broad spectrum coverage of fastidious pathogens.
- Aerobic or anaerobic capability.
- CO₂ for the growth enhancement of many fastidious pathogens.
- Thiol Broth for neutralization of all expected blood levels of penicillins, streptomycin and sulfas.
- SPS to inhibit the action of the blood’s natural defenses.
- Sucrose to give osmotically sensitive cells the chance to survive.
- Systems that provide room for an adequate blood sample (5-10 ml.).
- Closed system to minimize contamination during sample collection.
- Uniquely stoppered system to minimize contamination during subculturing procedures.
