ESM Fig. 2 ORs for diabetes prevalence across the 12 individual urbanisation components, by sex\textsuperscript{a,b}

Results of 12 sex-stratified multilevel logistic regression models per sex, with individual-level age and household income as fixed effects and with the community and province of residence as random effects.

ORs for diabetes prevalence presented for the 75\textsuperscript{th} (high) relative to the 25\textsuperscript{th} (low) percentile of each of the 12 urbanisation index components.
